KF04 - 481.040.000
KF05 - 481.050.000

Application

For the monitoring of oil level in tanks (maximum viscosity 1500 cSt)

Operation

A float equipped with a permanent magnet fluctuates with the level of liquid and works magnetically over a contact assembled and hermetically sealed inside a guide pipe.

Detection types

[C] : 1 level detection

[D-E-F-G] : 2 levels detection (min. and max.)

[H] : 2 levels detection (minimum and prealarm)

Technical characteristics

Guide pipe material.....brass / Aisi 316

Float material.....nylon void

Temperature range..... -20°C...+80°C

Assembly position..... ± 10° vertical

Degree of protection..... IP54

Maximum pressure..... 2 bar

Reed switch:

Voltage..... 230 VUC

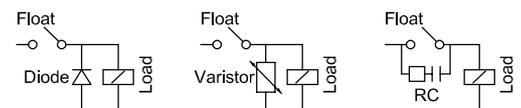

Connection..... 0,5 A

Power breakdown..... 30 W

Warning: protection of reed contacts against overloads

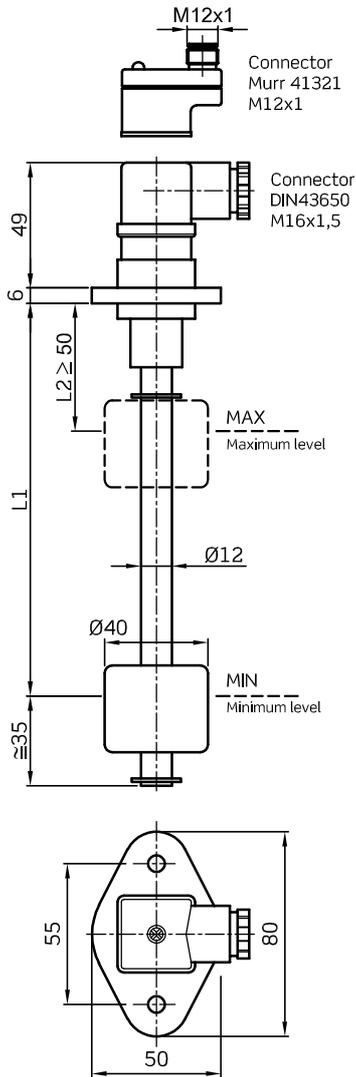

High input voltage, voltage peaks, inductive or capacitive loads may affect negatively the operation of reed contacts and they could even destroy them.

Under certain circumstances this energy can be transformed into an electric arc that can cause contact welding therefore it is appropriate to install protective circuits: diodes, varistors, RC elements.

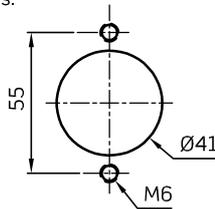

The equipment for a level switch does not include these protection elements therefore they should be foreseen and adapted to the particular needs of each user.

Diagrams
in page 5

The diagrams shown refer to levels assembled in tanks without oil (minimum level contact activated).
When the float reaches the stops: it opens or closes the contact. While the float remains at the stops the signals are kept.

5 polos

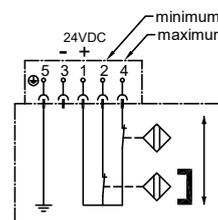

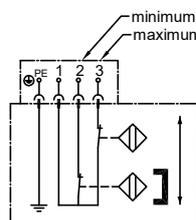

C 1 level detection (SPDT)

With full tank the float closes contact 1-2.
As the tank empties the float opens 1-2 on its descending route and closes 1-3 when it reaches the minimum level.
As the float rises the cycle reverses.

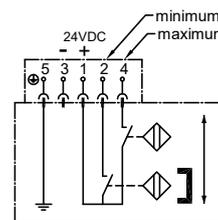

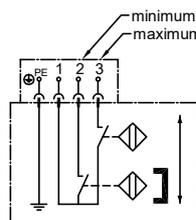

D 2 levels detection: minimum (NO) and maximum (NC)

With full tank the float reaches the stop at the top ring and opens contact 1-3.
As the tank empties the float closes contact 1-3 on its descending route and closes 1-2 when it reaches the bottom stop.
As the float rises the cycle reverses.

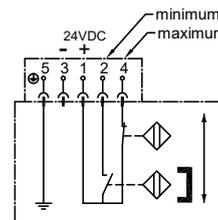

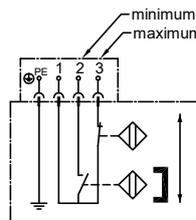

E 2 levels detection: minimum (NC) and maximum (NO)

With full tank the float reaches the stop at the top ring and closes contact 1-3.
As the tank empties the float opens contact 1-3 on its descending route and opens 1-2 when it reaches the bottom stop.
As the float rises the cycle reverses.

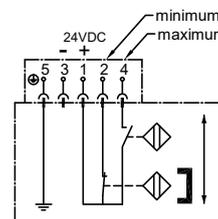

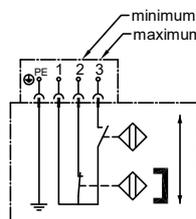

F 2 levels detection: minimum (NC) and maximum (NC)

With full tank the float reaches the stop at the top ring and opens contact 1-3.
As the tank empties the float closes contact 1-3 on its descending route and opens 1-2 when it reaches the bottom stop.
As the float rises the cycle reverses.

G 2 levels detection: minimum (NO) and maximum (NO)

With full tank the float reaches the stop at the top ring and closes contact 1-3.
As the tank empties the float opens contact 1-3 on its descending route and closes 1-2 when it reaches the bottom stop.
As the float rises the cycle reverses.

H 2 levels detection: minimum (NC) and prealarm (NO)

With full tank the float reaches the stop at the top ring and closes contact 1-3.
As the tank empties the float opens contact 1-3 on its descending route and opens 1-2 when it reaches the bottom stop.
As the float rises the cycle reverses.

The distance between prealarm and alarm is fixed: ~30mm
